

CRÉATIONS SOINS®

FOCUSOMES®

» FOCUSED SKINCARE BASED ON SKIN CELL COMMUNICATION

We have been observing live skin with our ***In Vivo Confocal Laser Reflectance Microscope (CLRIM)*** for over 3 years.

These observations have allowed us to understand better the diffusion and cell communication activities. Both actions are needed to allow a real effect on skin cells from the epidermis to the live dermis.

Through our research we have found a simple conclusion; the importance of an isotonic formula. It delivers and communicates correctly with an appropriate zeta potential force and allows maximum time factor presence of the cells being “focused on”.

Our observation has allowed us to see an instantaneous reaction to the skin in the right level of these markers for optimized vectorization.

Introducing Focusomes®

Focusomes® are a stable emulsion system within your formula, diffusing actives as needed to the correct cell level and ensuring optimal efficacy. **Focusomes®** allow customers to achieve real, optimal vectorization of their actives. They come with our unique integrated laboratory to assist R&D labs to achieve real vectorization, allowing the improvement of most active efficiency by a factor of 4.
